Interpretation Notes:-

A complete blood count gives information regarding the cell types in person's blood and concentration of haemoglobin. Cells that circulate in the blood are generally divided into three types: RBC, WBC and platelets. Abnormally high or low counts may occur in physiological conditions and in diseased states and requires clinical correlation. Differential counts and RBC indices help in further understanding of the likely aetiology.

NOTE: This report has been generated by a fully automated analyser after counting thousands of cells and hence differential count may appear as decimalized numbers.
